VenueGPS

PROPOSAL

Venue Insights

Proof that VenueGPS brings people through the door, and a dashboard to run the business.

Analytics plan and dashboard demo · Prepared by Zeeshan · 24 October 2026

THE PROBLEM

Venues pay every month. If they can’t see what VenueGPS brought them, they leave.

THE ONE STORY WE SELL

“We put your venue in front of X people. Y of them took action. About Z showed up.”

So the plan is simple

Every number and every graph on the venue dashboard feeds this story. Anything that doesn’t, we leave out.

TWO AUDIENCES, TWO DASHBOARDS

One set of tracked events, used twice

VENUE ADMIN · VENUE INSIGHTS

For venue owners

Question: Is VenueGPS worth my monthly fee?

Where: Insights tab in the business account, plus a monthly email or PDF

Sees: only their own venue, events and campaigns

Fresh: yesterday’s totals, refreshed daily

VENUEGPS ADMIN

For the VenueGPS team

Question: Is the app growing, converting and keeping venues?

Where: internal dashboard built on GA4, BigQuery and billing

Sees: all users, all venues, all revenue

Fresh: daily

Why not just give venues a GA4 login? GA4 can’t safely limit a login to one venue, it hides small numbers, and it can’t show redemptions or push sends. Our own dashboard can, and it becomes a feature we control and can charge for.

ALL OPTIONS ON THE TABLE · 1 OF 2

Metrics from the current spec we keep or reshape

Metric in the spec	Decision	How it shows up
Impressions, reach, frequency	Keep · now	People reached card, funnel, boosted vs organic
Clicks, ticket engagement, saves, follows	Keep · now	Actions card and the impact funnel
Active followers	Keep · now	Followers card, with net new this period
CPM	Keep · now	Boost results, plus cost per action, which owners understand better
Conversion rate	Keep · now	View to action rate per event
Dwell time	Rename	“Average time on your page” (physical dwell needs location data)
New customers, retention	Rename	“New vs returning visitors” to the venue page
Indexing, proximity	Keep · phase 2	“You vs similar venues” index (100 = city median)
Footfall, location uplift	Keep · phase 2	“Likely visited” and “Confirmed visit”
Geo-targeted audience concentration	Keep · phase 2	Audience by home city, city level only
Retargeting engagement, search lift	Keep · phase 3	Re-engaged users after a push; venue searches before vs after a boost

ALL OPTIONS ON THE TABLE · 2 OF 2

Metrics we move, hold or drop, and why

Metric in the spec	Decision	Reason
MRR, ARR, churn, churn revenue, LTV, ARPU	Move to Admin	VenueGPS's own business numbers, not the venue's
Gross and net volume, GBOR, ATP, sell-through	Only if tickets sell in-app	Otherwise needs ticket partner data and capacity per event
Net profit, break-even, ROI	Drop	We don't know the venue's costs. Show cost per action and per visit
TRPs	Drop	A TV planning metric, meaningless for one venue
Secondary market pricing	Drop	No data source
Merch per head	Drop for now	Needs a point-of-sale integration
Monthly listeners, pre-saves, song adoption, skip rates	Drop	Streaming metrics, only relevant with a Spotify integration

Why cut half the list?

A number that is always zero, or one an owner can't act on, hurts trust. Fewer, honest numbers sell renewals better.

Also: daily refresh instead of real-time. It's enough for owners and far cheaper.

WHAT WE'RE GOING WITH

Version 1 scope, and what waits

NOW · VENUE INSIGHTS

5 headline cards + 8 graphs

1. Impact funnel
2. Activity over time
3. Event performance
4. Boosted vs organic
5. Push results
6. Where your audience comes from
7. When people look at you
8. You vs similar venues

NOW · VENUEGPS ADMIN

6 KPIs + 9 reports

- Growth trend
- Revenue mix
- Onboarding funnel
- Business funnel
- Content supply by city
- Explore and ad placements
- Retention cohorts
- Acquisition
- Venue health and churn risk

LATER · ONCE V1 IS USED

Optional add-ons

- What your audience likes
- Where people found you
- Follower growth chart
- Retargeting and search lift
- Ticket sales metrics, if in-app
- Plan conversion funnel (Admin)

VENUE INSIGHTS · TOP ROW

Five headline cards an owner reads in ten seconds

People reached

Unique people who saw the venue or its events, anywhere in the app.

Shows the size of the audience VenueGPS gives them.

Profile and event views

Opens of the venue page or an event page.

Proves people were interested enough to look.

Actions taken

Directions, ticket clicks, calls and website taps.

The closest thing to a booking an app can see.

Visits from VenueGPS

Confirmed and likely visits, always shown apart.

Answers the question owners care about most.

Followers

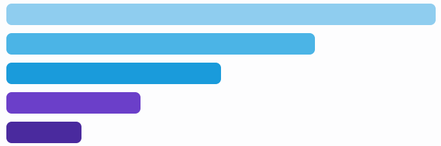

Total followers, plus net new this period.

Shows an audience they own and can push to.

Every card shows the change against the previous period, with a 7, 30 or 90 day picker at the top.

VENUE INSIGHTS · GRAPHS 1 TO 4

Each graph answers one question an owner asks

1 · FUNNEL

VenueGPS impact funnel

“How many people did you bring me?”

Reached, viewed, saved, acted, visited. The whole value story in one picture, and it shows where people drop off.

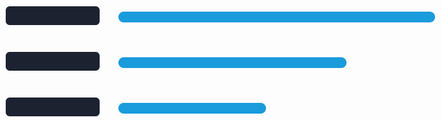

2 · LINE CHART

Activity over time

“Is it working more this month?”

Event nights and pushes are marked on the line, so owners see what caused each spike and do more of it.

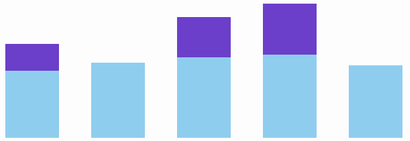

3 · SORTABLE TABLE

Event performance

“Which events pulled the crowd?”

Views, saves, ticket clicks and view-to-action rate per event. Owners learn which nights to repeat.

4 · STACKED BARS

Boosted vs organic

“Was the boost money worth it?”

Spend, CPM and cost per action. When boosts clearly pay off, owners buy more of them.

VENUE INSIGHTS · GRAPHS 5 TO 8

From “what happened” to “what to do next”

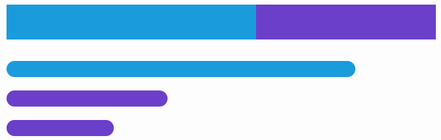

5 · BAR PER CAMPAIGN

Push results

“Did my push bring people?”

Sent, opened and actions within 24 hours. Showing full results for the free push makes paid triggers an easy sell.

6 · SPLIT + CITY BARS

Where your audience comes from

“Locals or tourists?”

Home city from onboarding. Owners plan offers for visitors, and VenueGPS can sell tourist reach.

7 · HEATMAP

When people look at you

“When should I post or push?”

Views by weekday and hour, with a plain tip like “push on Friday around 6 pm”.

8 · INDEX BARS

You vs similar venues

“Am I doing well?”

100 is the city median for the same venue type. It gives every number a context a raw total can’t.

PROVING “PEOPLE WHO CAME BECAUSE OF VENUEGPS”

Three levels of proof, labelled and never mixed

INTENT

“Planned to come”

Tapped Get Directions, a ticket link or Call.

Works today with app events.

ESTIMATED

“Likely visited”

Viewed or saved the venue, then was inside its area within 7 days.

Needs opt-in background location.

VERIFIED

“Confirmed visit”

Door offer redeemed, QR check-in, or ticket scanned at the door.

Needs venues to accept a door offer.

Fastest win: a “Show this at the door” VenueGPS offer. The app already has a 15% discount pop-up. Each redemption is a confirmed visit, and staff confirm it with one tap.

VENUEGPS ADMIN · FOR THE INTERNAL TEAM

One screen to run growth, revenue and venue success

Active users | New sign-ups | Live venues | Paying venues | MRR | Venue churn

Growth trend

Active users and sign-ups vs last period. Spots a slowdown early.

Revenue mix

Plans, boosts and push triggers. Shows what to push and how to price.

Onboarding funnel

All 9 new screens, mobile vs desktop. Finds the screen losing users.

Business funnel

Claim, approval, first event, first boost. Shows where venues stall.

Content supply by city

Live events and venues per city. Flags thin cities for sales.

Explore and ad placements

Impressions and click rate per slot. Tells you which slots to price higher.

Retention cohorts

Do new users come back after their first weekend?

Acquisition

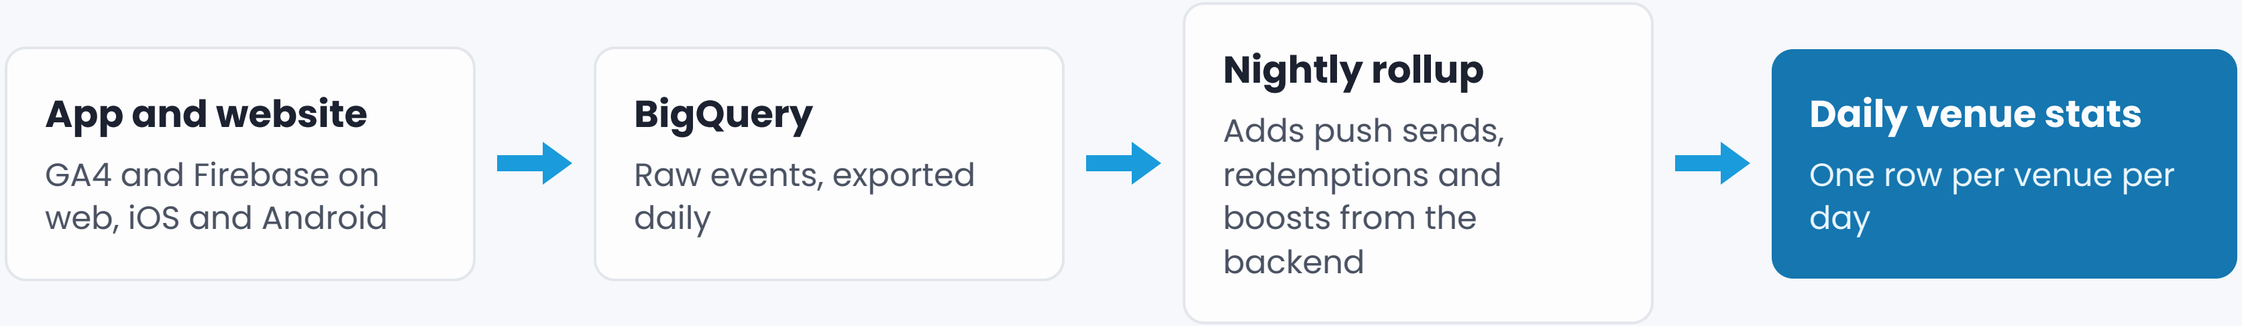

Which channels bring users who stay, so marketing money goes there.

Venue health and churn risk

A weekly call list of paying venues getting little value, before they cancel.

HOW IT WORKS

Track once, roll up nightly, show each venue only its own row

Venue Insights

Reads only that venue’s rows. Fast, cheap, and one venue can never see another.

VenueGPS Admin

Reads all of it, joined with billing for MRR and churn.

Day one task: turn on the GA4 BigQuery export. History can’t be added later, so every day it’s off is lost data.

WHAT WE TRACK

A short event list that powers every graph

Every venue event carries: venue_id · event_id · campaign_id · placement · is_boosted · city

venue_impression card seen for 1 second	**venue_view, event_view** detail page opened	**venue_follow, event_save** interest shown	**get_directions** planning to come
ticket_click ticket or buy link	**call_click, website_click** contact taps	**push_open** notification opened	**offer_redeem** door offer used
ad_impression, ad_click banners and boosts	**search, share** discovery and spread	**onboarding_step** each of the 9 screens	**sign_up, subscription_*** account and plan changes

Sent from the backend, not the app: push_sent, push_delivered, claim_approved, boost_purchased, trigger_purchased, visit_estimated. These are the source of truth for counts the app can’t see.

PRIVACY RULES

Venues see counts, never people

Totals only

No names, emails or lists of viewers. Owners see a follower count, not who follows.

Groups of 10 or more

Any slice under 10 users shows as “fewer than 10”, so no one can be singled out.

City level only

Raw location stays on the server and is deleted after visits are matched.

Consent first

iOS tracking prompt, consent mode on web, background location opt-in only. The privacy policy says venues get aggregate stats.

ROLLOUT

Tracking first, then each phase earns the next

PHASE 0

Tracking

- GA4 and Firebase events on web, iOS, Android
- BigQuery export on
- Backend events for pushes and boosts

Gate: events match real app usage in BigQuery

PHASE 1

Insights v1

- 5 cards, graphs 1 to 5
- Door offer for confirmed visits
- Admin KPIs, funnels, revenue

Gate: pilot venues use it and say it helps

PHASE 2

Full picture

- Graphs 6 to 8
- “Likely visited” with opt-in location
- Monthly email or PDF
- Churn risk list

Gate: enough venues per city to benchmark

PHASE 3

Add-ons

- Retargeting and search lift
- Audience interests
- Ticket partner data

Gate: chosen from how owners use v1

Why tracking first: every graph depends on it, and GA4 history can’t be backfilled.

WHAT VENUEGPS GETS

Insights pays for itself in four ways

Fewer cancellations

Every visit to the dashboard is a reason to renew.

More boost and push sales

Cost per action makes the return visible, so owners buy again.

A feature to charge for

Full Insights can be a premium tier, with a preview on lower plans.

A sharper team

Churn alerts, thin cities and slot pricing tell sales where to act.

> Owners stop asking “is this working?” because the answer is on their screen every morning.

WHAT WE NEED FROM YOU

Eight answers, and we can start

1. Are tickets sold inside VenueGPS, or only linked out?
2. Is GA4 or Firebase installed, and is the BigQuery export on?
3. What is the current backend and database?
4. Will venues accept a door offer or QR check-in?
5. Does the app ask for background location today?
6. Is Insights in every business plan, or a premium upsell?
7. Do promoters and touring artists need their own view?
8. Which cities are live, so benchmarks are fair?

Next step: approve the v1 scope and switch on tracking this week. Every day without the BigQuery export is data we can’t get back.

SEE IT LIVE

Both dashboards, clickable, in the VenueGPS look

VENUE ADMIN

Skyline Rooftop Bar (sample venue)

Switch 7, 30 or 90 days, turn compare on and off, flip Views and Actions, sort the event table.

VENUEGPS ADMIN

Team dashboard

Switch the date range, the growth metric and the onboarding platform, and read the churn risk list.

Open the live demo · the pill at the top right switches between the two dashboards. All numbers are sample data.
